

In this assignment, I learned how to use javascript to create the interaction. In the javascript, I constructed objects to create "appointment" which includes variables like vaccine type, date, time. For 6A, I used this information to make a confirmation message. I think the role of objects is very important because it allows us to store information. In the next iteration, I am going to use local storage to apply the stored information. For example, I hope the appointment made can go to the "My appointment" page so it is more responsive. Since I will make many changes to the Schedule page, I didn't make it very hi-fi for now. I will definitely improve the aesthetics of the Schedule page in my next iteration. The most challenging part as I worked is to connect my javascript file with my html file. I am not familiar with the grammar so it is hard to start at the beginning. But I do find the practice that we did for Lab 7 super helpful.
